INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference E047488-GL	FOR FURTHER ACTION	see Notification of Transmittal of International Search Report (Form PCT/ISA/220) as well as, where applicable, item 5 below.
International application No. PCT/EP 01/ 00566	International filing date (day/month/year) 22/01/2001	(Earliest) Priority Date (day/month/year) 07/02/2000
Applicant GUALA DISPENSING S.P.A. et al.		

This International Search Report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This International Search Report consists of a total of 3 sheets.

It is also accompanied by a copy of each prior art document cited in this report.

1. Basis of the report

- a. With regard to the **language**, the international search was carried out on the basis of the international application in the language in which it was filed, unless otherwise indicated under this item.
 - the international search was carried out on the basis of a translation of the international application furnished to this Authority (Rule 23.1(b)).
- b. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international search was carried out on the basis of the sequence listing :
 - contained in the international application in written form.
 - filed together with the international application in computer readable form.
 - furnished subsequently to this Authority in written form.
 - furnished subsequently to this Authority in computer readable form.
 - the statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.
 - the statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished

2. **Certain claims were found unsearchable (See Box I).**

3. **Unity of invention is lacking (see Box II).**

4. With regard to the **title**,

- the text is approved as submitted by the applicant.
- the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

- the text is approved as submitted by the applicant.
- the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority.

6. The figure of the **drawings** to be published with the abstract is Figure No.

- as suggested by the applicant.
- because the applicant failed to suggest a figure.
- because this figure better characterizes the invention.

17

None of the figures.

- 1 -

CLOSURE FOR CONTAINERS, IN PARTICULAR PLUG FOR BOTTLES

The present invention refers in general to a closure for containers, and in particular to a plug 5 for bottles, preferably adapted to be used to plug bottles of wine.

Due to its preferred application as currently provided, the following description will be oriented to the case in which the closure of the invention is 10 applied to the field of bottles for foodstuff, in particular of bottles of wine, so that the closure will assume the configuration of a bottle plug. It is clear, however, that the teachings of the present invention are equally applicable to containers for any 15 type of substance (foodstuff or otherwise) that needs a sealed closure capable on one hand of preventing the contained substance from leaking out, and on the other hand of preventing gases and/or foreign substances (including, for example, the material of which the 20 closure is composed) from entering inside the container.

In the field of plugs for bottles of wine, the most common material of which they are made is cork: such material is costly, increasingly difficult to 25 obtain, since it comes from specific plants and

- 2 -

therefore is available in nature in relatively limited amounts.

Moreover, plugs made of cork have many problems from the functionality point of view: studies 5 in the field have demonstrated that in high percentages such plugs damage the wine contained in the bottles, giving it a taste that is no longer the original one and that is always unpleasant to the palate. When the wine contained in these bottles is 10 precious, the presence of a faulty plug is wasteful and implies heavy costs.

Even when plugs made of cork do not show defects, it is advisable to periodically replace them (10-15 years), to avoid spoiling the bottle contents.

15 Cork also gives rise to problems in terms of its installation and removal from bottles: in fact, automatic plugging machines are exposed to dust and pieces of cork that become detached, polluting the environment and impairing process quality; moreover, 20 cork is a non-uniform material, so that its behaviour differs from one supply batch to the next; finally, when the plug is removed from a bottle, for example using an ordinary corkscrew, it can happen that small bits of cork fall inside the bottle itself and pollute 25 its contents.

- 3 -

Studies are being carried out to produce plugs for bottles made of plastic material that provide equivalent performances to those of plugs made of cork without the abovementioned problems, but the practical 5 results so far are unsatisfactory in various aspects, so that it has not yet been possible to produce a closure that allows the replacement of cork as material (even with all problems generated thereby, as mentioned above), while providing the same positive 10 characteristics.

The object of the present invention is to solve the abovementioned problems of the prior art, by providing a closure made of plastic material for containers that has optimum sealing characteristics, 15 preventing gases and/or foreign substances from entering inside the containers and preventing the substance contained in the containers themselves from leaking out.

A further object of the present invention is 20 to provide a closure of the wine bottle plug type that can be applied to the bottle neck sizes that are currently deemed as standard for bottles of this type, that can be adapted without modifications to the automated machinery for plugging bottles themselves 25 and that can be removed from bottles using ordinary

- 4 -

removing means of the corkscrew type. Moreover, the plug of the invention allows the organoleptic characteristics of the wine contained to be preserved, and therefore it finds a preferred application in the 5 storage of wines of the still and lightly sparkling types, and in the storage of precious wines.

The above and other objects and advantages of the invention, as will appear from the following description, are obtained by a closure for containers 10 as claimed in claim 1. Preferred embodiments and non-obvious variations of the present invention are claimed in the dependent claims.

The present invention will be better described by some preferred embodiments thereof, given by way of 15 non-limiting examples, with reference to the attached drawings, in which:

- Figure 1 is a side cross-sectional view of a first embodiment of a closure for containers according to the present invention;
- 20 - Figure 2 is a perspective view of the supporting and sealing means of the closure in Fig. 1;
- Figure 3 is a side cross-sectional view of a second embodiment of a closure for containers 25 according to the present invention;

- 5 -

- Figure 4 is a side cross-sectional view of a third embodiment of a closure for containers according to the present invention;

- 6 -

according to the present invention;

- Figure 13 is a perspective view of the supporting and sealing means of the closure in Fig. 11; and
- 5 - Figures 14 to 16 are side cross-sectional views of an eleventh embodiment of a closure for containers according to the present invention;
- Figure 17 is a perspective sectional view of a 10 twelfth embodiment of a closure for containers according to the present invention;
- Figure 18 is a side cross-sectional view of the embodiment in Figure 17;
- Figure 19 is an exploded perspective view of a 15 thirteenth embodiment of the closure for containers according to the present invention;
- Figure 20 is a side cross-sectional view of the embodiment in Figure 19.

With reference to the figures, the closure for 20 containers according to the invention will be described hereinbelow. As can be seen from the figures and as will clearly appear from the following description, numerous constructive variations of the closure are possible, all having in common the 25 characteristics claimed in the claims. It will be

- 7 -

obvious for the persons skilled in the art, therefore, that the embodiments shown and described are only examples and do not limit the scope of the invention that is defined by the attached claims.

5 In general, as can be seen from the figures, the closure for containers of the invention comprises supporting and sealing means 3 and a covering body 5 (commonly, but not in a limiting way, placed externally with respect to the supporting and sealing means 3) made of plastic material (commonly, but not in a limiting way, elastomeric material): the covering body 5 in Fig. 1 is placed around the supporting and sealing means 3 in order to assume, for example, the external cylindrical shape of a bottle plug (Fig. 2).
10 The dimensions of the covering body 5 are such as to allow it to be inserted into a traditional bottle neck (not shown) and then to cooperate with the internal walls thereof, due to the elastomeric material of which the plug 1 is made, to guarantee a perfect seal
15 for the substance contained inside the bottle. The covering body 5 in practice cooperates by interference with the container opening to prevent the material contained therein from leaking out and to prevent gases and/or foreign substances from entering inside
20 the container itself. The supporting and sealing means
25

- 8 -

3 are useful both for supporting the closure 1 in a longitudinal direction, and for strengthening the seal thereof with the container at one or more points. The supporting and sealing means 3 are important, since 5 the elastomeric material could in time elongate and partly impair the sealing functionality: this is prevented by the means 3 above all in the part of the closure 1 facing the container interior.

According to a preferred embodiment of the 10 invention, the covering body 5 is made of thermoplastic foam material, or of thermosetting foam material.

According to another preferred embodiment of the invention, the covering body 5 may alternatively 15 be made of crosslinked foam material, of the commonly marketed types such as APO (marketed by the company API). Obviously, other materials with equivalent functionalities, that will become available in the art in the future, can be used.

If the material employed is a foam elastomer, 20 the manufacturing process must include hot molding in the presence of a blowing agent which may be of chemical or physical type and is selected from those usually used in analogous processes. However, a 25 particularly preferred process for hot-molding the

- 9 -

closure (1) uses a fluid in the supercritical state as a blowing agent. As is known, a fluid in the supercritical state is a fluid maintained at a pressure and temperature above that material's 5 critical pressure and temperature and therefore behaves in ways characteristic of both a liquid and a gas. For example, this fluid will have a solvent power similar to that of a liquid, but a surface tension much weaker than that of a liquid and such as to 10 increase its diffusion through the solute.

The method according to the present invention involves the following steps:

- (a) providing a source of supercritical fluid at a temperature and pressure greater than the critical temperature and pressure of that supercritical fluid;
- (b) preheating the polymer material to a temperature above the supercritical fluid's critical temperature, preferably above the softening or melting temperature of this polymer material;
- (c) saturating the polymer material that was preheated in step (b) with the

- 10 -

supercritical fluid by maintaining the interior of the saturation chamber at a temperature and pressure greater than the critical temperature and pressure of the supercritical fluid, said preheated polymer material and said supercritical fluid preferably being mixed in said saturation chamber in order to facilitate the saturation process;

(d) injecting said preheated polymer material saturated with the supercritical fluid into a closure mold, reducing the pressure to below the critical pressure of the supercritical fluid;

(e) and maintaining said polymer material in the mold until formation of the closure is complete.

The preferred supercritical fluid for the process outlined above is nitrogen in the supercritical state, for which the critical temperature and pressure are, respectively, T = -147°C approx. and P = 3.389×10^6 N/m² approx.

The process outlined above is particularly

- 11 -

advantageous as we have observed that it produces a material with an extremely homogeneous structure of minute microcells (from 10^9 to 10^{12} cells per cm^3 , the mean size of the cells being less than 2 microns). The
5 closure therefore acquires remarkable sealing properties and properties of impermeability to gases.

In the abovementioned practical embodiments, the closure 1 of the invention in its shape as a plug is therefore adapted to be placed in a bottle, in
10 order to close it, using an ordinary plugging machine (not shown), and is adapted to be removed from a bottle, when opening, using an ordinary corkscrew (not shown). The material of which the plug 1 is composed guarantees barrier characteristics and characteristics
15 ensuring a lack of material leakage for a period that is not less than the one that can be obtained with a plug made of cork under optimum conditions.

In order to perform the abovementioned barrier function, the closure 1 of the invention is further
20 equipped with barrier means (not shown), for example in the form of at least one circular thin layer placed on the side of the closure 1 facing the container interior; said thin layer is made of a material suitable for forming such a barrier, for example even
25 gold. Other types of barrier means could be at least

- 12 -

one disk or at least one washer, for example made of glass for better storage of the product inside the container.

According to a first preferred embodiment of
5 the closure 1, shown in Figs 1 and 2, the supporting and sealing means 3 are composed of a threaded hollow fitting 7, that extends substantially along the whole length of the closure 1; the fitting 7 is connected to at least one lower support 9 and at least one upper
10 support 11. The connection between the fitting 7 and the upper and lower supports 9 and 11 can occur by screwing, fixing by complementary shape or other known ways.

The lower support 9 is adapted to be coupled
15 by interference with the container opening walls to prevent gases from entering thereinto, while the upper support 11 is adapted, by means of the insertion recess 12, to allow insertion of a corkscrew into the closure 1 for the removal thereof, using, in order to
20 engage the corkscrew, a plurality of longitudinal ribs 7'. The closure 1 of Figs 1 and 2 has the lower support 9 shaped (in 10) in order to support the covering body 5 that expands therein, and to simultaneously provide insertion means to insert the
25 closure 1 inside the container opening (in this case

- 13 -

the bottle neck).

According to a second preferred embodiment of the closure of the invention, shown in Fig. 3, the supporting and sealing means 3 are composed of at least one lower threaded support 13 and at least one upper threaded support 15 that are screwed into corresponding recesses formed inside the covering body 5 and that engage a hollow elongated support member 14.

The lower support 13 is adapted to be coupled by interference with the container opening to prevent gases from entering thereinto, while the upper support 15 is adapted, by means of an insertion recess 20, to allow insertion of a corkscrew into the closure 1 for the removal thereof. Moreover, the elongated support member 14 is equipped with a plurality of longitudinal ribs 21 for engagement with the corkscrew when removing the plug 1. Also in this case, the closure 1 of Fig. 3 has the lower support 13 shaped (in 13') in order to support the covering body 5 that expands inside it, and to simultaneously provide insertion means to insert the closure 1 into the container opening (in this case the bottle neck).

In both the above-illustrated arrangements, the upper support (11 or 15 depending on the case) is

- 14 -

further adapted to bear writing and/or other signs relating to the container contents, such as for example product name or manufacturer name, advertising messages, etc.

5 According to a third preferred embodiment of the closure 1 of the invention, shown in Figs 4 and 5, the supporting and sealing means 3 are composed of an elongated support body 26 that extends substantially along the whole length of the closure 1; such
10 elongated support body 26 is further equipped with at least one lower sealing member 28 adapted to guarantee sealing of the closure 1 against the container opening walls.

In the embodiment shown in Figs 4 and 5, the
15 covering body 5 is of cylindrical shape and the lower sealing member 28 is shaped as a frustum of a cone whose radius is less than the radius of the covering body 5.

Always as shown in Figs 4 and 5, the elongated
20 support body 26 is further equipped with at least one upper sealing member 30 adapted to improve sealing of the closure 1 against the container opening walls. The upper sealing member 30 is also shaped as a frustum of a cone whose radius is less than the radius of the
25 covering body 5 and is substantially identical to the

- 15 -

radius of the lower sealing member 28.

Moreover, the elongated support body 26 is of cylindrical shape and is closed at the end thereof that is facing toward the container interior: this 5 obviously serves to increase the sealing strength of the whole closure 1, and can also be used during removal of the closure 1 from the container to prevent, for example, the corkscrew from drilling right through the plug 1, such operation being always 10 inadvisable in the field.

According to a fourth preferred embodiment of the invention, shown in Fig. 6, the supporting and sealing means 3 are composed of a first hollow member 30 whose cross section is "T"-shaped and a second 15 hollow member 32, whose cross section is in the shape of an inverted "T", that is adapted to contain an end of the first hollow member 30 through threaded engagement of the respective ends 31 and 33 of the two members 30 and 32. The arrangement in Fig. 6 allows 20 the closure 1 to be used by orienting it and inserting it at will into the container, since both ends 30' and 32' of the supporting and sealing means 3 have the same shape and are equipped with the recesses 35 and 37 for inserting the means for removing the closure 1.

25 According to a fifth preferred embodiment of

- 16 -

the invention, shown in Fig. 7, the supporting and sealing means 3 are composed of a cylindrically-shaped upper hollow member 40 open at both ends 41 and 42, in order to increase the seal against the container opening walls. The upper member 40 is placed above and outside a lower hollow member 43 that, in its central part 44, is shaped as an elongated cylinder that is inserted into the upper member 40, while in its part 46 facing toward the container interior it is shaped 10 as a flat closure with insertion flarings 48 for insertion of the closure 1 into the container. Once the upper member 40 and the lower member 43 have been coupled, they are surrounded by the covering body 5 so that the plastic material of which this is composed 15 penetrates into the spaces left empty due to coupling of the two members 40 and 43, and penetrates into the lower member 43 in such a way that its part 46, substantially performing the function of a barrier, is outside the covering body 5. The recess 49 allowing 20 penetration of the removing means into the closure 1 is in this case directly formed in the covering body 5.

According to a sixth preferred embodiment of the invention, shown in Fig. 8, the supporting and 25 sealing means 3 are composed of three mutually coupled

- 17 -

internal hollow members, in which the first internal hollow member 50 has an elongated cylindrical shape and a step 51 formed inside it and two respective threaded coupling sections 52 and 53. The first 5 internal hollow member 50 is further equipped with a circular upper sealing projection 54. The second internal hollow member 55 has a cylindrical shape and is equipped in its upper part with a recess 56 for insertion of the means for removing the closure 1 and 10 is equipped in its lower part with a threaded section 57 adapted to cooperate through engagement with the corresponding threaded section 52 of the first internal hollow member 50; moreover, the second internal member 55 abuts against the first internal 15 member 50 on the shoulder of the step 51 in order not to excessively penetrate into the first member 50. Finally, the third internal hollow member 58 is almost completely threaded in 59 in order to cooperate 20 through engagement with the respective threaded section 53 of the first internal member 50, and is equipped with a lower flat part 60 that performs sealing and barrier functions for the closure 1, being oriented toward the container interior. In the arrangement in Fig. 8, the covering body 5 is applied 25 outside the three internal hollow members 50, 55, 58,

- 18 -

while, inside, the closure 1 remains equipped with a hollow cylindrical recess 61 into which the means for removing the closure 1 will penetrate.

According to a seventh preferred embodiment of
5 the invention, shown in Fig. 9, the supporting and sealing means 3 are composed of a bearing member 63 having a substantially elongated cylindrical shape, that is externally threaded in 64 all along its length and is internally equipped with a plurality of ribs 65
10 for engaging with the means for removing the closure 1. Around such bearing member 63 are screwed a first closure member 66 and a second closure member 67 that are identical and are composed of an internally threaded cylindrical body 66', 67' closed at one end
15 by a circular flat cover 66'', 67'' with its external edges bent slightly inwards. After the first and the second closure members 66, 67 have been screwed onto the bearing member 63, the covering body 5 is applied so that it covers the three members 63, 66, 67 and is
20 contained inside the bent edge of the covers 66'', 67''.
The closure 1 of this arrangement likewise does not have an upper and a lower part, but can be used under any desired vertical orientation.

According to an eighth preferred embodiment of
25 the invention, shown in Fig. 10, the supporting and

- 19 -

sealing means 3 are composed of a bearing member 70 having a substantially elongated cylindrical shape, that is internally threaded in 71 all along its length and is internally equipped with a cylindrical threaded structure 72 that is screwed inside it and that helps in further reinforcing it. Inside this bearing member 70 are screwed an upper closure member 73 and a lower closure member 74. The upper closure member 73 is equipped with a cylindrical threaded body 74 that is 5 screwed inside the bearing member 70 and that is overlapped by a cover 75 containing a recess 76 for insertion of the means for removing the closure 1. The lower closure member 74 is composed of a cylindrical threaded body 77 adapted to be screwed inside the 10 bearing member 70, and a circular flat lower cover 78 with flarings 79 for insertion into the container opening; in this case, however, the lower closure member 74 is shaped in such a way as to form a circular recess 80 between cylindrical body 77 and 15 cover 78: the recess 80 is adapted to house an end of the bearing member 70 to increase the sealing and strength of the supporting and sealing means 3 as a whole. In this arrangement, after having produced the supporting and sealing means 3 by coupling their 20 various components, the covering body 5 is expanded in 25

- 20 -

order to surround them, leaving the covers 75 and 78 outside.

According to a ninth preferred embodiment of the invention, shown in Figs 11 and 13, the supporting and sealing means 3 are composed of an upper closure member 91 and a lower closure member 92. The upper closure member 91 is composed of a hollow cylindrical body equipped at one of its ends with a plurality of small teeth 93 and at the opposite end with a cover 94 having a recess 95 for insertion of the means for removing the closure 1. The lower closure member 92 is composed of a hollow cylindrical body equipped at one of its ends with a plurality of small teeth 96 and at the opposite end with a circular flat cover 97 equipped with a circular collar 98 adapted to contain the material of the covering body 5. The covering body 5 is expanded around the two closure members 91 and 92 in order to surround their respective cylindrical bodies and to engage their respective small teeth 93 and 96, penetrating into the recess 98 and leaving only the covers 94 and 97 outside.

Moreover, according to a tenth preferred embodiment of the invention, shown in Fig. 12, the supporting and sealing means 3 are composed of an upper closure member 101 and a lower closure member

- 21 -

102. The upper closure member 101 is composed of a hollow cylindrical body equipped at one of its ends with a tooth 103 and at the opposite end with a cover 104 having a recess 105 for insertion of the means for
5 removing the closure 1. The lower closure member 102 is composed of a hollow cylindrical body equipped at one of its ends with a tooth 106 and at the opposite end with a circular flat cover 107 equipped with a circular collar 108 adapted to contain the material of
10 the covering body 5. The supporting and sealing means 3 in this case receive an internal reinforcement from the mutual coupling of the two teeth 103 and 106. The covering body 5 is expanded around the two closure members 101 and 102 in order to surround their
15 respective cylindrical bodies, penetrating into the recess 108 and leaving only the covers 104 and 107 outside.

According to an eleventh preferred embodiment of the invention, shown in Figs 14 to 16, the
20 supporting and sealing means 3 are composed of an upper closure member 121 and a lower closure member 122. The upper closure member 121 is composed of a hollow cylindrical body equipped at one of its ends with a threaded or toothed wall 123 and at the
25 opposite end with a cover 124 having a recess 125 for

- 22 -

insertion of the removing means for the closure 1. The lower closure member 122 is composed of a hollow cylindrical body equipped at one of its ends with a threaded or toothed recess 126 and at the opposite end 5 with a circular flat cover 127 equipped with a circular collar 128 adapted to contain the material of the covering body 5. The supporting and sealing means 3 in this case are produced through the mutual coupling of the wall 123 and the recess 126 by means 10 of their threads or small teeth. The covering body 5 is expanded around the two closure members 121 and 122 in order to surround their respective cylindrical bodies, penetrating into the recess 128 and leaving only the covers 124 and 127 outside. Fig. 16 shows in 15 detail the coupling between the closure 1 and the mouth 182 of the container (not shown).

In the embodiment shown in Figures 17 and 18, the supporting and sealing means 3 are composed of a reinforcing member 129 having a basically cylindrical hollow body 130 terminating at both ends in annular shoulders 131, 131'. The lower annular shoulder 131, which is at the end of the closure 1 designed to be inserted in the neck of the container, is of a larger diameter than the upper shoulder 131'.

25 On the outer surface of the hollow body 130,

- 23 -

between these shoulders 131, 131', is a plurality of annular reliefs 132. These lie in essentially parallel planes and are preferably equidistant from each other. The diameter of said annular reliefs 132 is in general 5 less than that of the shoulders 131, 131'.

The lower end of the hollow body 130 is closed by a base 133, while the upper end remains open.

The covering body 5 is thermoformed directly on said reinforcing member 129, in such a way that the 10 elastomeric material fills the cavity of the hollow body 130 and the external space between the two shoulders 131, 131'. The annular reliefs 132 give the covering body 5 purchase. It is clear therefore that the closure 1 will assume a frustoconical shape, with 15 the larger base designed to be inserted into the neck of the container. This maximizes the seal created by the closure. The fact that the annular reliefs 132 do not extend radially as far as the lateral surface of the covering body 5 further contributes to the seal of 20 the closure and moreover does not spoil the aesthetic appearance of the closure, as clearly shown in Figure 17.

Another important feature of this embodiment is that the base 133 of the hollow body 130 is 25 oriented toward the interior of the container and

- 24 -

therefore gives the closure 1 excellent impermeability to atmospheric oxygen. Meanwhile, the other end of the hollow body 130 is, as stated earlier, open and filled with the elastomeric foam material. This facilitates
5 the insertion of the corkscrew.

In the embodiment shown in Figures 19 and 20, the supporting and sealing means 3 are composed of a reinforcing member 134 and a closure member 135. These are coupled together detachably.

10 The reinforcing member 134 comprises a basically cylindrical hollow body 136 closed at the lower end by a base 137 and open at the upper end. Around the outside of said lower base 137 is an upwardly directed annular profile 138. Inside the
15 hollow body 136 is a plurality of longitudinal fins 139 that extend from the inside surface of the hollow body 136 into the interior. The purpose of these fins 139 is to strengthen the structure and guide the corkscrew as it is inserted, being tapped by the
20 corkscrew as it goes in.

The closure member 135 comprises a disk 140 whose upper surface includes a central depression 141. On the lower surface of said disk 140 is a sleeve 142 whose outside diameter is approximately equal to or
25 slightly less than the inside diameter of the hollow

- 25 -

body 136, so that the closure member 135 can be inserted into said hollow body. As with the hollow body 136, a plurality of longitudinal fins is provided on the inside surface of the sleeve 142.

5 The covering body 5 is of basically cylindrical form, but with an outward swelling to maximize the seal formed by the closure. The interior is hollow and its surface has ribs 144 lying in planes perpendicular to the axis of the covering body 5. This
10 covering body 5 is pushed onto the hollow body 136, and then the closure member 135 is inserted on top of that. In this way the covering body 5 is held between the annular profile 138 and said closure member 135. The ribs 144 encourage the compression of the material
15 and its elastic return, which means that the covering body can be made from a wide variety of different materials, such as, besides those described earlier, silicone, in particular an LSR (Liquid Silicone Rubber), preferably a two-component LSR.

20 As will appear evident to a person skilled in the art from the above description of some preferred embodiments of the invention, what has been shown and described must obviously be considered as a non-limiting example of the scope of the present invention
25 as defined in the attached claims. In fact, numerous

- 26 -

variations of the abovementioned embodiments are possible, through a simple combination of the various members shown or by designing new members performing the same functions of support, seal, barrier and 5 covering of the fundamental members of which the closure 1 of the present invention is composed.

Finally, as further particularity, all closures 1 of the invention, both the abovementioned closures and others that could be easily developed by a person 10 skilled in the art upon reading the present specification, can be further strengthened by providing their coating with a protective film placed all around them, where in particular the protective film could be a silicone film.

When it comes to producing labels, drawings or captions on the surface of the closure (1) according to the invention, the invention allows the use of laser-based methods in addition to the normal technologies of ink printing. The type of laser and 20 the amount of energy required for this marking process will depend on the plastic material being marked. For the material used in the closures of the present invention it will usually be preferred to use an Nd:YAG laser having a power of 30 to 200 Watts and a 25 wavelength of 1064 nm (secondary waves

- 27 -

532-355-266 nm). The plastic material of which the plug is composed must be treated with a color-changing master that changes coloration when struck by the laser beam. A preferred master is SARMATENE® from 5 Clariant. The color-changing master is added in quantities of between 1% and 4%, preferably approximately 2%. The choice of a laser-marking method involving the use of a color-changing master, instead of laser processes where the marking is produced by 10 surface carbonization, is fundamental because in the case of a closure for containers in which leaktightness of the container is essential, marking by surface carbonization leads irremediably to unacceptable surface irregularities. These surface 15 irregularities would then prevent compliance with the inside surface of the neck of the container as required for an airtight closure.

The equipment for carrying out the marking process is of known type and commercially available 20 and will not therefore be described in greater detail.

- 28 -

CLAIMS

1. A closure (1) for containers characterized in that it comprises:

5 - rigid supporting and sealing means (3); and
- a covering body (5) made of plastic material,
said covering body (5) cooperating with and
integrating said supporting and sealing means
(3).

10 2. The closure (1) for containers as claimed in claim 1, characterized in that said covering body (5) is placed on the outside around said supporting and sealing means (3).

15 3. The closure (1) for containers as claimed in claim 1 or 2, characterized in that said covering body (5) is made of an elastomeric material.

4. The closure (1) for containers as claimed in claim 1, characterized in that said covering body (5) is adapted to cooperate by interference with the 20 container opening to prevent the product contained therein from leaking out and to prevent gases and/or foreign substances from entering inside the container.

5. The closure (1) for containers as claimed in any one of claims 1 to 4, characterized in that said 25 covering body (5) is made of thermoplastic foam

- 29 -

material.

6. The closure (1) for containers as claimed in any one of claims 1 to 4, characterized in that said covering body (5) is made of thermosetting foam
5 material.

7. The closure (1) for containers as claimed in any one of claims 1 to 4, characterized in that said covering body (5) is made of crosslinked foam material.

10 8. The closure (1) for containers as claimed in any one of claims 1 to 7, characterized in that said closure (1) is a plug for containers for foodstuff.

9. The closure (1) for containers as claimed in claim 8, characterized in that said plug (1) is
15 adapted to close bottles containing beverages.

10. The closure (1) for containers as claimed in claim 9, characterized in that said plug (1) is adapted to close bottles containing alcoholic beverages, in particular wine.

20 11. The closure (1) for containers as claimed in any one of claims 8 to 10, characterized in that said plug (1) is adapted to be placed onto a bottle, in order to close it, using an ordinary plugging machine, and is adapted to be removed from a bottle, when
25 opening it, using ordinary plug (1) removing means.

- 30 -

12. The closure (1) for containers as claimed in claim 11, characterized in that said plug (1) removing means are a corkscrew.

13. The closure (1) for containers as claimed in 5 claim 1, characterized in that said closure (1) has gas-barrier characteristics, preventing gases from penetrating inside the container, and characteristics ensuring a lack of leakages of the closure material into the container, said barrier and lack-of-leakage 10 characteristics being guaranteed for a period that is not less than the one that can be obtained with a closure made of cork under optimum conditions.

14. The closure (1) for containers as claimed in claim 13, characterized in that it is further equipped 15 with barrier means placed on the side of said closure (1) facing the container interior.

15. The closure (1) for containers as claimed in claim 14, characterized in that said barrier means are composed of at least one thin layer.

20 16. The closure (1) for containers as claimed in claim 15, characterized in that said at least one thin layer is made of a precious metal, for example gold.

17. The closure (1) for containers as claimed in 25 claim 14, characterized in that said barrier means are composed of at least one disk, for example made of

- 31 -

glass.

18. The closure (1) for containers as claimed in claim 14, characterized in that said barrier means are composed of at least one washer, for example made of
5 glass.

19. The closure (1) for containers as claimed in any one of the preceding claims, characterized in that said supporting and sealing means (3) are composed of a fitting (7), in particular a threaded hollow fitting
10 (7), that extends substantially along the whole length of the closure (1), said fitting (7) being connected to at least one lower support (9) and at least one upper support (11), said at least one lower support (9) being adapted to be coupled by interference with
15 the container opening to prevent gases from entering thereinto, said at least one upper support (11) and said fitting (7) being adapted to allow insertion of closure (1) removing means into the closure (1) for the removal thereof.

20. The closure (1) for containers as claimed in claim 19, characterized in that said at least one upper support (11) is equipped with a recess (12) for insertion of closure (1) removing means and said fitting (7) is equipped with a plurality of ribs (7')
25 for engaging with said closure (1) removing means.

- 32 -

21. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of at least one lower threaded support (13) and at least one 5 upper threaded support (15) that are screwed into corresponding recesses formed inside said covering body (5), said at least one lower support (13) being adapted to be coupled by interference with the container opening to prevent gases from entering 10 thereinto, said at least one upper support (15) being adapted to allow insertion of closure (1) removing means into the closure (1) for the removal thereof.

22. The closure (1) for containers as claimed in claim 21, characterized in that said at least one 15 lower threaded support (13) and said at least one upper threaded support (15) are adapted to engage a hollow elongated support member (14) placed inside said closure (1).

23. The closure (1) for containers as claimed in 20 claim 22, characterized in that said upper support (15) is equipped with an insertion recess (20) for the closure (1) removing means and said elongated support member (14) is equipped with a plurality of longitudinal ribs (21) for engaging said closure (1) 25 removing means.

- 33 -

24. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of an elongated support body (26) that extends substantially along the whole length of the closure (1), said elongated support body (26) being equipped with at least one lower sealing member (28) adapted to guarantee sealing of the closure (1) against the container opening walls.

10 25. The closure (1) for containers as claimed in claim 24, characterized in that said covering body (5) is of cylindrical shape and said lower sealing member (28) is shaped as a frustum of a cone whose radius is less than the radius of the covering body (5).

15 26. The closure (1) for containers as claimed in claim 24 or 25, characterized in that said elongated support body (26) is further equipped with at least one upper sealing member (30) adapted to improve sealing of the closure (1) against the container opening walls.

20 27. The closure (1) for containers as claimed in claim 26, characterized in that said covering body (5) is of cylindrical shape and said upper sealing member (30) is shaped as a frustum of a cone whose radius is less than the radius of the covering body (5).

- 34 -

28. The closure (1) for containers as claimed in any one of claims 24 to 27, characterized in that said elongated support body (26) is of cylindrical shape and is closed at the end thereof that is facing toward 5 the container interior.

29. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of a first hollow member (30) whose cross section is "T"-shaped and a second hollow member (32) whose cross 10 section is in the shape of an inverted "T", said second hollow member (32) being adapted to contain inside an end of said first hollow member (30) through threaded engagement of respective ends (31; 33) of 15 said two members (30, 32), said members (30, 32) being equipped with respective ends (30'; 32') having the same shape and being respectively equipped with recesses (35; 37) for inserting means for removing said closure (1).

20 30. The closure (1) for containers as claimed in any of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of a cylindrically-shaped upper hollow member (40) open at both ends (41, 42), said upper member (40) being 25 placed above and outside a lower hollow member (43)

- 35 -

that, in its central part (44), is shaped as an elongated cylinder that is inserted into said upper member (40), said lower member (43) in its part (46) facing toward the container interior being shaped as a 5 flat closure equipped with insertion flarings (48) for insertion of said closure (1) into the container, a recess (49) allowing penetration of removing means into said closure (1) being directly formed in said covering body (5).

10 31. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of three mutually coupled internal hollow members (50, 55, 58), said first internal hollow member (50) having an 15 elongated cylindrical shape and comprising a step (51) formed inside it and two respective threaded coupling sections (52, 53), said first internal hollow member (50) being further equipped with a circular upper sealing projection (54), said second internal hollow member (55) having a cylindrical shape and being equipped in its upper part with a recess (56) for 20 insertion of means for removing said closure (1) and being equipped in its lower part with a threaded section (57) adapted to cooperate through engagement 25 with the corresponding threaded section (52) of said

- 36 -

first internal hollow member (50), said second internal member (55) abutting against said first internal member (50) on the shoulder of said step (51) in order not to excessively penetrate into said first 5 member (50), said third internal hollow member (58) being almost completely threaded (in 59) in order to cooperate through engagement with the respective threaded section (53) of said first internal member (50), and being equipped with a lower flat part (60) 10 to perform a sealing and barrier function for said closure (1).

32. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of a 15 bearing member (63) having a substantially elongated cylindrical shape, said bearing member (63) being externally threaded (in 64) all along its length and being internally equipped with a plurality of ribs (65) for engaging with means for removing said closure 20 (1), around said bearing member (63) there being screwed a first closure member (66) and a second closure member (67) that are identical and are composed of an internally threaded cylindrical body (66', 67') closed at one end by a circular flat cover 25 (66'', 67'') with its external edges bent slightly

- 37 -

inwards.

33. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of a
5 bearing member (70) having a substantially elongated cylindrical shape, said bearing member (70) being internally threaded (in 71) all along its length and being internally equipped with a reinforcement cylindrical threaded structure (72) screwed inside it,
10 an upper closure member (73) and a lower closure member (74) being screwed inside said bearing member (70), said upper closure member (73) being equipped with a cylindrical threaded body (74) that is screwed inside said bearing member (70) and that is overlapped
15 by a cover (75) containing a recess (76) for insertion of means for removing said closure (1), said lower closure member (74) being composed of a cylindrical threaded body (77) adapted to be screwed inside said bearing member (70) and a circular flat lower cover
20 (78) with flarings (79) for insertion into the container opening, said lower closure member (74) being shaped in such a way as to form a circular recess (80) between cylindrical body (77) and cover (78), said recess (80) being adapted to house an end
25 of the bearing member (70) to increase the sealing and

- 38 -

strength of said supporting and sealing means (3).

34. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of an upper closure member (91) and a lower closure member (92), said upper closure member (91) being composed of a hollow cylindrical body equipped at one of its ends with a plurality of small teeth (93) and at the opposite end with a cover (94) having a recess (95) for insertion of means for removing said closure (1), said lower closure member (92) being composed of a hollow cylindrical body equipped at one of its ends with a plurality of small teeth (96) and at the opposite end with a circular flat cover (97) equipped with a circular collar (98) adapted to contain the material of said covering body (5).

35. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of an upper closure member (101) and a lower closure member (102), said upper closure member (101) being composed of a hollow cylindrical body equipped at one of its ends with a tooth (103) and at the opposite end with a cover (104) having a recess (105) for insertion of means for removing said closure (1), said lower

- 39 -

closure member (102) being composed of a hollow cylindrical body equipped at one of its ends with a tooth (106) and at the opposite end with a circular flat cover (107) equipped with a circular collar (108)
5 adapted to contain the material of said covering body (5).

36. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) are composed of an
10 upper closure member (121) and a lower closure member (122), said upper closure member (121) being composed of a hollow cylindrical body equipped at one of its ends with a threaded or toothed wall (123) and at the opposite end with a cover (124) having a recess (125)
15 for insertion of means for removing the closure (1), said lower closure member (122) being composed of a hollow cylindrical body equipped at one of its ends with a threaded or toothed recess (126) and at the opposite end with a circular flat cover (127) equipped
20 with a circular collar (128) adapted to contain the material of said covering body (5).

37. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) comprise a
25 reinforcing member (129) having a basically

- 40 -

cylindrical hollow body (130) terminating at both ends in annular shoulders (131, 131'), a lower and an upper, said lower annular shoulder (131) having a larger diameter than said upper shoulder (131'), a plurality of annular reliefs (132) being situated on the outer surface of the hollow body (130), the lower end of said hollow body (130) being closed by a base (133) and its upper end open, and the covering body (5) being formed directly on said reinforcing member 10 (129), in such a way that the elastomeric material fills the cavity of said hollow body (130) and the external space between said lower and upper shoulders (131, 131'), said closure (1) being frustoconical in shape.

15 38. The closure (1) for containers as claimed in any one of claims 1 to 18, characterized in that said supporting and sealing means (3) comprise a reinforcing member (134) and a closure member (135), these being coupled together detachably, said 20 reinforcing member (134) comprising a basically cylindrical hollow body (136) closed at the lower end by a base (137) and open at the upper end, around the outside of which lower base (137) is an upwardly-directed annular profile (138), a plurality 25 of longitudinal fins (139) being provided on the

- 41 -

inside surface of said hollow body (136); which closure member (135) comprises a disk (140) whose upper surface includes a central depression (141) and on whose lower surface is a sleeve (142) whose form 5 and dimensions are such that it can be inserted into said hollow body (136), a plurality of longitudinal fins (143) being provided on the inside surface of said sleeve (142); which covering body (5) is of basically cylindrical form with an outward swelling 10 and an internal cavity, the surface of which is provided with ribs (144).

39. The closure (1) for containers as claimed in claim 38, in which said covering body (5) is made of LSR silicone.

15 40. The closure (1) for containers as claimed in any one of the preceding claims, characterized in that said closure (1) is further adapted to bear, in its upper part facing outside the container, writing and/or other signs relating to the container contents.

20 41. The closure (1) for containers as claimed in any one of the preceding claims, characterized in that it is further covered with a protective film placed all around said closure (1).

25 42. The closure (1) for containers as claimed in claim 41, characterized in that said protective film

- 42 -

is a silicone film.

43. The closure (1) for containers as claimed in any one of the preceding claims, in which said thermoplastic foam material is made by a hot-molding process involving the use of a fluid in the supercritical state as a blowing agent.

44. The closure (1) for containers as claimed in claim 43, in which said fluid is nitrogen in the supercritical state.

10 45. The closure (1) for containers as claimed in any one of the preceding claims, in which the outside surface of said closure is marked by a laser-marking process.

15 46. The closure (1) as claimed in claim 45, in which said laser is an Nd:YAG laser.
